

## UI Color Scheme:

I included the HEX Color Codes. I want dark mode to be 24262E(Raisin Black) to be the background and D6D6D6(Timberwolf) to be the text. I want light mode to be the exact opposite, 24262E(Raisin Black) to be the text, D6D6D6(Timberwolf) to be the background. I want oxford blue for key buttons like login etc.

## UI Logo:

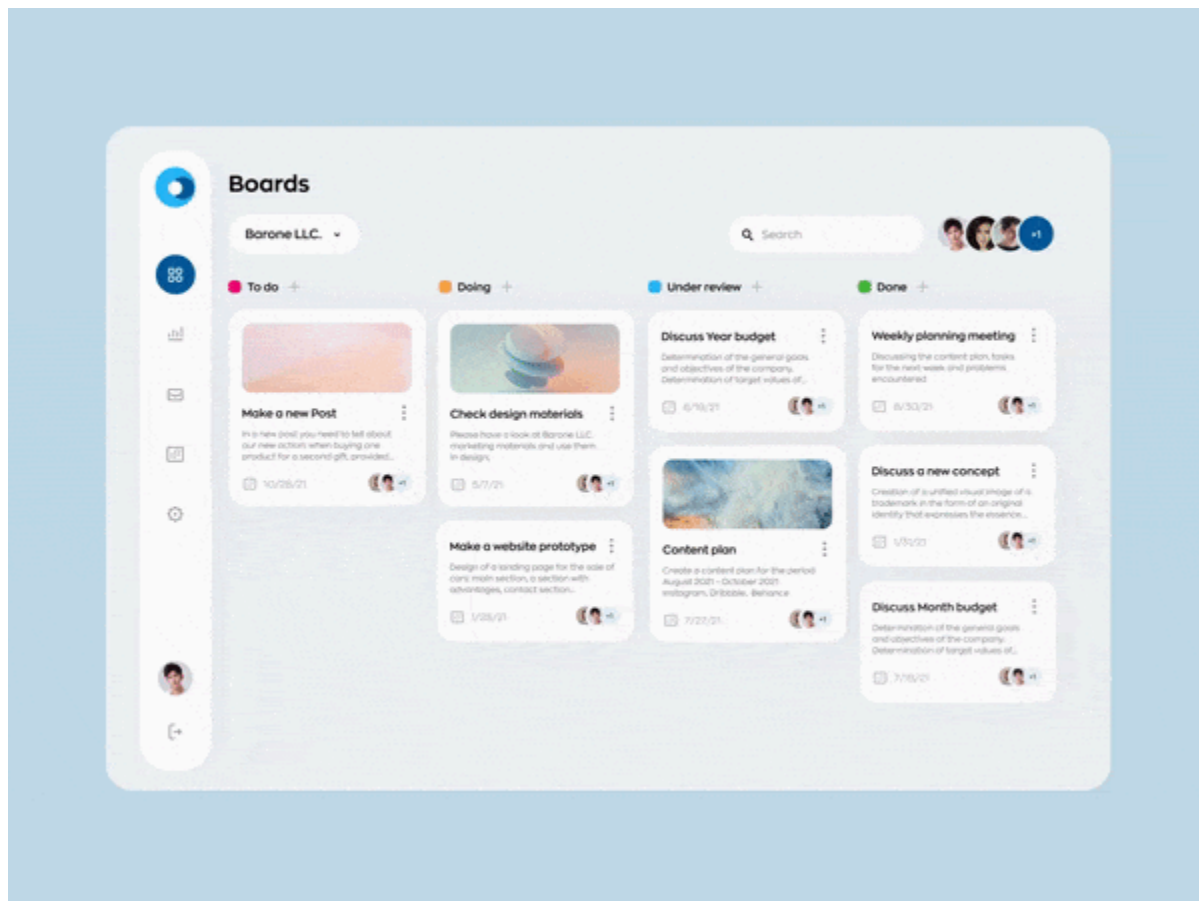

This is the logo of nexus. And use the colors from the color palette to look like this. Also I want the wheel thing to spin when stuff is loading like loading in, or compiling loading etc.

## UI Layout Notes:

Once logged in, the user should go to the Workstation Tab with all the projects laid out the user has been working with. There should be a create button to create a new project, in each project square, there should be options like share, download, export, etc. Rest of the information will be given from Ayush Tiwari. He has full detailed drawings and notes. Also I want the navigation in the website to different sections on the top left of the tab almost like google drive, **but** I want it to disappear when the curser isn't on the top left, basically generally have the philosophy of simplicity, intuitive. If something doesn't add value at a specific place, don't have it, simpler and cleaner is better.

Layout Example:

The left side should disappear when not interacting with the cursor. Also use the rounded rectangle aesthetic as shown above. But make them all equal size. Each rectangle should represent a project with the options of sharing, downloading, exporting, etc on each rectangular tab.
